Data was traditionally siloed in systems that don't talk to each other. This has led to:

- **Reason 1**: Construction hasn't had data analytics tools designed for construction.
- **Reason 2**: Data wasn't captured at the source.
- **Reason 3**: Every project is different so establishing one standard has been a challenge.
- **Reason 4**: 96% of project data goes unused.

This contributes to a massive loss of money, a waste of time and resources, and even safety risks.

- **13%**: 13% of project cost spent on rework.
- **30%**: 30% of all work performed by construction companies ends up being rework.
- **80%**: 80% of projects are late and over budget. Averaging delay is 20 months behind original schedule.

With better data, businesses estimate they can reduce project costs by 13%.

**A New Era for Business Intelligence in Construction**

Turn Unused Data to Actionable Insights

Procore Analytics turns project data into actionable business insights so you can reduce rework, avoid delays, and prevent jobsite injuries. With intelligent analysis that identifies trends for you, you'll squeeze every drop of value from your information.
